reached a peak of \$10B in 2019.

Global investment in PropTech

2020 was set to continue this trend, but COVID's effect on the real estate industry has been significant due to the negative effects on the underlying assets.

In the commercial real estate market, "working from home" made demand for shared office space and commercial real estate drop to all-time low. In the residential real estate market, mortgages were not spared from the general consumer credit crunch.

But even as it hits the real estate industry, COVID-19 will have a positive effect on the adoption of PropTech, because of 2 main factors: PropTech enables the **digital transformation of the real estate transaction** and it also **enables liquidity**.

1) Going digital has never been so important

Real estate is a business that has traditionally relied on face-to-face interaction. With home buying being the most valuable transaction most of us will ever make in our lives, our estate has relied heavily on the human element. It has also been heavily dependent on middlemen, such as brokers, agents, realtors and appraisers.

COVID-19 will only accelerate the adoption of these technologies by real estate buyers and sellers.

2) Proptech enables liquidity

Real estate is a highly illiquid asset class. It takes a lot of time to sell and buy because it's such a large transaction that requires so many manual stages and middleman intervention. It usually requires obtaining a mortgage to finance it (involving all the bureaucracy that comes with interacting a large financial institution), insurance, title transfers, appraisals, etc.

This is in opposition to the modern consumer lifestyle, which has been evolving through the forces of urbanization and the gig economy, and which is fundamentally opposed to having significant portions of net worth tied to an illiquid asset.

One of the greatest promises of Proptech is that it will streamline these processes, thereby making this asset class much more liquid. Moreover, lower transaction costs and complexities will draw more capital that is searching for yield in the post-COVID era, when interest rates are at historic lows.

Proptech and the COVID effect

Proptech already disrupted many aspects of the real estate market. Companies such as Zillow and Trulia transformed how listing and home discovery is done, and companies such as Opendoor invented i-buying. At Viola, we have been focusing our interest on some areas of Proptech that we still believe should be revolutionized: The home buying journey, Financing, Investing, and Ancillary services.

Online as property information became easier to access. In recent years, 51% of home buying transactions were initiated online. Still, the majority of home buyers transition to an offline, complicated, and analog transaction process that is:

- **Enormously costly** – commissions, title costs, and other fees can tally to about \$20,000 per transaction, not to mention wasted time and opportunity cost.
- **Time consuming** – on average, it takes 4.3 months to buy a home, and 2.8 months to sell.

AR/VR, IoT and mortgage FinTech startups are disrupting the industry by making it easier for both buyer and seller to automate the real estate transaction and to access financing.

Companies of note in Bucket #1:

LendingHome

The COVID Effect on Bucket #1: *Positive*

As people continue to worry about the health effects of face-to-face interaction, the digitization process of the few pieces of the journey that are still predominantly face to face will be significantly accelerated. Think about virtual home showing, or self-service house showing powered by IoT devices a la **August Home** or **Alexa**.

“sell to stay” models to cash-strapped consumers.

Companies of note in Bucket #2:

The COVID Effect on Bucket #2: *Positive*

In times of crisis, cash is king. Any solution that increases liquidity, especially to consumers who may find it hard to obtain financing from traditional providers such as incumbent banks, have a good chance to thrive in the current environment.

Bucket #3: Investing

Historically, real estate as an asset class, especially commercial RE, has been an attractive investment. However, barriers such as high upfront investment and its illiquid nature made it suitable only to larger investors that can afford very long investment horizons. As a result, over the past few years, several companies started disrupting this space by **digitizing real estate assets, which enable both lower investment amounts as well as liquid markets to trade these assets.**

Startups are employing various models to disrupt real estate investing, including

crowdfunding, utilizing **big data analytics** to surface high quality investments, employing **AI** to automatically build diversified RE portfolios, and using DLT to **tokenize properties** and turn them into transferrable and tradable tokens,

representing shares and other financial instruments.

FUNDRISE

REALTYMOGUL

The COVID Effect on Bucket #3: *Negative*

Given the predicted fall in occupancy of commercial real estate properties on the one hand, and the expected surge in missed mortgage payments on the other, real estate prices will decline across the board and real estate investing will take a hit.

COVID-19 has caused companies to adopt work from home policies that we believe will persist long after the health effects of the pandemic are past us. As more employees work from home, these companies will require less office space, and the value of commercial real estate assets will fall, which will affect investor appetite for this entire asset class.

That said, we still believe that the opening of commercial real estate to non-institutional investors is a positive phenomenon, and in the long term we're closely watching companies that continue to liquidize these assets to make them a viable part of investment portfolios.

Bucket #4: Ancillary services

Whether you buy, rent or rent out, any real estate transaction involves many ancillary interactions with financial services providers such as banks, insurance companies or payment processors that provide a slew of services from rent payment to renter's, home and HOA insurance and security deposits.

Many of these transactions are still manual – think paying your rent with checks. We use cookies to improve our Website functionality. Detailed information on our cookies is provided in our Cookie Policy. By using our Website or by choosing I Accept, you consent to our use of cookies.

The COVID Effect on Bucket #4: *Neutral*

While COVID-19 will definitely accelerate the trends of going-paperless for some transactions, such as rent payments (e.g. paying with cards or with Venmo instead of checks), we believe that services such as home insurance will not fundamentally change or be affected by the current crisis.

A message from the author:

My name is Tomer Michaeli, I'm a General Partner at **Viola FinTech**. Prior to joining Viola, I was the co-founder (one of three) and VP Operations at Fundbox, a leading global FinTech company in the credit and payments sector. Check out my full bio [here](#). I've been interested in the global proptech industry for a long time, and **I'm always on the lookout for new investments**. If you're doing something in the Proptech space, and you feel your company falls into one of the buckets I described, ping me.
